

Application No. 10/630,478  
Amdt. Dated May 9, 2006  
Reply to Office Action of January 9, 2006

**Amendments to the Specification:**

On Page 12, please amend the third paragraph to:

D. Retrieve the first expander by screwing out in a reverse direction. After ~~receiving~~ retrieving the expander, the interior wall of the osseotomy site remains grooves which are complementary to the structure of the expander. This is fundamentally different from the osseotomy site created by the known osteotome technique where the interior wall of the osseotomy site is smooth without grooves.
